

Cammandas to run one by one

Scene 1 — Show the project structure

```
powershell
cd C:\Users\User\OneDrive\DocumentFiles\PROJECTS\metaHackthon\metaHackthon\files
dir
```

Say: *"This is my AI Email Triage Agent — built in Python, connects to real Gmail"*

Scene 2 — Show the AI brain (system prompt)

Open `inference_gmail.py` in VS Code and scroll to `SYSTEM_PROMPT`

Say: *"This is the AI prompt — it decides classify, priority, and whether to reply"*

Scene 3 — Run Task 1 (Classification only)

```
powershell
python inference_gmail.py --task task1 --emails 5
```

Say: *"First, the agent reads real emails and classifies them — spam, important, or normal"*

Scene 4 — Run Task 2 (Classification + Priority)

```
powershell
python inference_gmail.py --task task2 --emails 5
```

Say: *"Now it also assigns priority — high, medium, or low — for each email"*

Scene 5 — Run Task 3 (Full Triage + Auto Reply)

```
powershell
python inference_gmail.py --task task3 --emails 5
```

Say: *"Now the full pipeline — classify, prioritize, and automatically send replies only to real humans. Security alerts and automated emails are blocked"*

Scene 6 — Show Gmail inbox (reply arrived)

Open Gmail in browser, show the sent reply in the thread

Say: *"And here it is — the AI actually sent the reply in the correct email thread"*

Scene 7 — Show results JSON

powershell

`type results_gmail.json`

Say: *"Every run is scored and saved — classification accuracy, reward, steps taken"*
